

## ALI / ETL Certification Program

BendPak is a proud member of the [Automotive Lift Institute](#). We share ALI's ongoing mission to promote better, safer automotive lifts and applaud other manufacturers who join us in the ALI / ETL certification program.

Since 1945, ALI has been providing reliable, third-party laboratory testing and review services for auto lift design, engineering, construction and installation. Both manufacturers and end-users benefit immensely from their in-depth scrutiny to ensure that safety, above all else, is built into every auto lift. ALI / ETL certification is a proven, invaluable source of information and peace of mind for the men and women who work beneath auto lifts every day.

**The gold ALI / ETL certification badge is the only nationally recognized standard for automotive lifts of all designs**, whether they be two post lifts, four post lifts, scissor lifts, in-ground lifts, alignment lifts or parking lifts. BendPak is pleased to see that more and more consumers are willing to dig deeper, cut through the hype and only trust lifts with an ALI / ETL seal of approval. With all you have to lose, there is simply no reason why your lift should not meet the very highest industry safety and performance standard available.

Some might argue that it's just a little gold sticker—but when it comes to you, your employees, your family and your property, that little gold sticker is the only thing that carries as much weight as a BendPak auto lift itself.

An automotive lift bearing the ALI Certification Mark, as shown above and an ETL or MET Listing Mark, as applicable, indicates that the lift complies with the following requirements. When considering the purchase of an automotive lift, always request the manufacturer's list of available model numbers representing "Certified Lifts", [or click here to view the ALI-Directory of Certified Lifts](#).

1. Automotive lift models must be tested in accordance with the Program Procedural Guide and in accordance with the performance requirements of the American National Standard "Automotive Lifts - Safety Requirements for Construction, Testing, and Validation" ANSI/ALI ALCTV (current edition).
2. All motor operated automotive lift models must be listed by a [Nationally Recognized Testing Laboratory \(NRTL\)](#), in accordance with ANSI/UL 201 entitled "American National Standard for Safety for Garage Equipment"; and for installation in Canada, in accordance with CAN/CSA C22.2 No. 68.
3. The Certification Program participant's Authorized Production Facility (APF) must meet quality control requirements set forth in the Program Procedural Guide, as verified by frequent surveillance and plant inspections.
4. Manufacturer-provided instructions and manuals, as well as lift operator safety documents, must be comprehensive and conform to the requirements of the Program Procedural Guide.
